Multiple discrete random variables

If X and Y are two discrete variables, their joint probability mass function is defined as

$$p_{X,Y}(x,y) = P(X = x \cap Y = y) = P(X = x, Y = y).$$

CPU example

A box contains 5 PowerPC G4 processors of different speeds:

#	speed			
2	400 mHz			
1	450 mHz			
2	500 mHz			

Randomly select two processors out of the box (without replacement) and let

- ullet X be speed of the first selected processor and
- Y be speed of the second selected processor.

CPU example - outcomes

	1st processor (X)					
	Ω	400_{1}	400_{2}	450	500_{1}	500_{2}
2nd processor (Y)	400_{1}	-	×	Х	×	×
	400_{2}	×	-	X	×	×
	450	×	×	-	×	×
	500_{1}	×	×	X	-	×
	500_{2}	X	X	×	×	-

Reasonable to believe each outcome is equally probable.

CPU example - joint pmf

Joint probability mass function for X and Y:

		1st processor (X)			
			450		
2nd processor (Y)	400	2/20	2/20	4/20	
	450	2/20	0/20	2/20	
	500	4/20	2/20 0/20 2/20	2/20	

- What is P(X = Y)?
- What is P(X > Y)?

CPU example - probabilities

What is the probability that X = Y?

$$P(X = Y)$$
= $p_{X,Y}(400, 400) + p_{X,Y}(450, 450) + p_{X,Y}(500, 500)$
= $2/20 + 0/20 + 2/20 = 4/20 = 0.2$

What is the probability that X > Y?

$$P(X > Y)$$
= $p_{X,Y}(450, 400) + p_{X,Y}(500, 400) + p_{X,Y}(500, 450)$
= $2/20 + 4/20 + 2/20 = 8/20 = 0.4$

Expectation

The expected value of a function h(x,y) is

$$E[h(X,Y)] = \sum_{x,y} h(x,y) p_{X,Y}(x,y).$$

CPU example - expected absolute speed difference

What is E[|X - Y|]?

Here, we have the situation E[|X-Y|] = E[h(X,Y)], with h(X,Y) = |X-Y|. Thus, we have

$$\begin{split} E[|X-Y|] &= \sum_{x,y} |x-y| \, p_{X,Y}(x,y) = \\ &= |400-400| \cdot 0.1 + |400-450| \cdot 0.1 + |400-500| \cdot 0.2 \\ &+ |450-400| \cdot 0.1 + |450-450| \cdot 0.0 + |450-500| \cdot 0.1 \\ &+ |500-400| \cdot 0.2 + |500-450| \cdot 0.1 + |500-500| \cdot 0.1 \\ &= 0 + 5 + 20 + 5 + 0 + 5 + 20 + 5 + 0 = 60. \end{split}$$

Marginal distribution

For discrete random variables X and Y, the marginal probability mass functions are

$$\begin{array}{ll} p_X(x) &= \sum_y p_{X,Y}(x,y) & \text{and} \\ p_Y(y) &= \sum_x p_{X,Y}(x,y) & \end{array}$$

Marginal distribution

Joint probability mass function for X and Y:

		1st processor (X)		
		400		
2nd processor (Y)	400	2/20	2/20	4/20
	450	2/20	0/20	2/20
	500	4/20	2/20 0/20 2/20	2/20

Summing the rows within each column provides

$$\begin{array}{c|ccccc} x & 400 & 450 & 500 \\ \hline p_X(x) & 0.4 & 0.2 & 0.4 \end{array}$$

Summing the columns within each row provides

 $y \parallel 400 \quad 450 \quad 500$

CPU example - independence

Are X and Y independent?

X and Y are independent if $p_{x,y}(x,y) = p_X(x)p_Y(y)$ for all x and y.

Since

$$p_{X,Y}(450, 450) = 0 \neq 0.2 \cdot 0.2 = p_X(450) \cdot p_Y(450)$$

they are **not** independent.

Covariance

The covariance between two random variables X and Y is

$$Cov[X, Y] = E[(X - \mu_X)(Y - \mu_Y)]$$

where

$$\mu_X = E[X]$$
 and $\mu_Y = E[X]$.

If Y=X in the above definition, then Cov[X,X]=Var[X].

CPU example - covariance

Use marginal pmfs to compute:

$$E[X] = E[Y] = 450 \qquad \text{and} \qquad Var[X] = Var[Y] = 2000.$$

The covariance between X and Y is:

$$\begin{aligned} &Cov[X,Y] \\ &= \sum_{x,y} (x-E[X])(y-E[Y])p_{X,Y}(x,y) = \\ &= & (400-450)(400-450)\cdot 0.1 \\ &+ (450-450)(400-450)\cdot 0.1 \\ &+ \cdots \\ &+ (500-450)(500-450)\cdot 0.1 \end{aligned}$$

$$= & 250+0-500+0+0+0-500+250+0 \\ &= & -500. \end{aligned}$$

Correlation

The correlation between two variables X and Y is

$$\rho[X,Y] = \frac{Cov[X,Y]}{\sqrt{Var[X] \cdot Var[Y]}} = \frac{Cov[X,Y]}{SD[X] \cdot SD[Y]}.$$

Correlation properties

- ullet ho is between -1 and 1
- if $\rho = 1$ or -1, Y is a linear function of X:
 - $\rho = 1 \implies Y = mX + b$ with m > 0,
 - $\rho = -1 \implies Y = mX + b$ with m < 0,
- ullet ρ is a measure of linear association between X and Y
 - ρ near ± 1 indicates a strong linear relationship,
 - ρ near 0 indicates a lack of linear association.

CPU example - correlation

Recall

$$Cov[X,Y] = -500$$
 and $Var[X] = Var[Y] = 2000$.

The correlation is

$$\rho[X,Y] = \frac{Cov[X,Y]}{\sqrt{Var[X] \cdot Var[Y]}} = \frac{-500}{\sqrt{2000 \cdot 2000}} = -0.25,$$

and thus there is a weak negative (linear) association.

Continuous random variables

Suppose X and Y are two continuous random variables with joint probability density function $p_{X,Y}(x,y)$. Probabilities are calculated by integrating this function. For example,

$$P(a < X < b, c < Y < d) = \int_{c}^{d} \int_{a}^{b} p_{X,Y}(x, y) \, dx \, dy.$$

Then the marginal probability density functions are

$$p_X(x) = \int p_{X,Y}(x,y) dy$$

$$p_Y(y) = \int p_{X,Y}(x,y) dx.$$

Continuous random variables

Two continuous random variables are independent if

$$p_{X,Y}(x,y) = p_X(x) p_Y(y).$$

The expected value is

$$E[h(X,Y)] = \int \int h(x,y) p_{X,Y}(x,y) dx dy.$$

Properties of variances and covariances

For any random variables X, Y, W and Z,

$$\begin{aligned} Var[aX+bY+c] &= a^2Var[X] + b^2Var[Y] + 2abCov[X,Y] \\ Cov[aX+bY,cZ+dW] &= acCov[X,Z] + adCov[X,W] \\ &+ bcCov[Y,Z] + bdCov[Y,W] \end{aligned}$$

$$\begin{aligned} Cov[X,Y] &= Cov[Y,X] \\ \rho[X,Y] &= \rho[Y,X] \end{aligned}$$

If X and Y are independent, then

$$Cov[X,Y] = 0$$

$$Var[aX + bY + c] = a^{2}Var[X] + b^{2}Var[Y].$$

Summary

- Multiple random variables
 - joint probability mass function
 - marginal probability mass function
 - joint probability density function
 - marginal probability density function
 - expected value
 - covariance
 - correlation
